READ ME

This project uses Java as a programming language and SQL for storage. Eclipse and MySQLWorkbench were the softwares used in this project to run the Java bakingapp file and bakeryapp mysql file specifically. The JDBC connector is also imported into the java file.

Our application is a database designed to store and view new recipes for bakers or everyday people to use. To run our database, download the SQL file and make sure all tables, values, procedures, functions, and triggers are inserted or created into the bakeryapp database. Next, download the Java bakingapp file and load it into eclipse or your preferred platform for running java code. Next, run the java program. It should automatically prompt the user in the console after you have hit the run button.
